

OPTION A | Smart Fitness Session Analyze

obligatory assignment

Student name	Student number	Course
Ida Cecilie Brænde Svendsen	s371425	ACIT4420 - oblig 1

Short project description

This code simulates an application that processes and analyses singular or multi session bio-metric

signal data (heart rate, skin response, body temperature, activity level and signal quality).

The intnetion of the aplication is to validate incoming date, filter corrupt observation, throught the validated data

The program classifies the session type, detects recovery period, counts valid/invalid data sets and data entries.

The main outputs to concider is a human readable printout of relevant data, alongside a summary dictionary of the same data

Class design and explanation of each class's responsibility (OOC architecture)

--> Clear identification of where composition, encapsulation, inheritance, and overriding are used (or justified)

--> Stated assumptions and classification rules
